

# Challenge 01 String Manipulation

---

## doesInclude(str, letter)

The doesInclude takes two parameters: str and letter. Check whether str includes the specified letter. The method returns true if the letter is found in the str and false otherwise.

## cap(str, letter)

Write a function named cap that accepts a string of letters and a string of a single letter. The function uppercases and returns the next letter in the string ex: accepts cap("hello", 'e') returns "L" Bonus: If letter is not found returns "Sorry, letter not found"

## firstCharacter(str1, str2)

Write a function named firstCharacter that takes two strings and returns true if both characters start with the same letter

Don't forget the bonus!!
